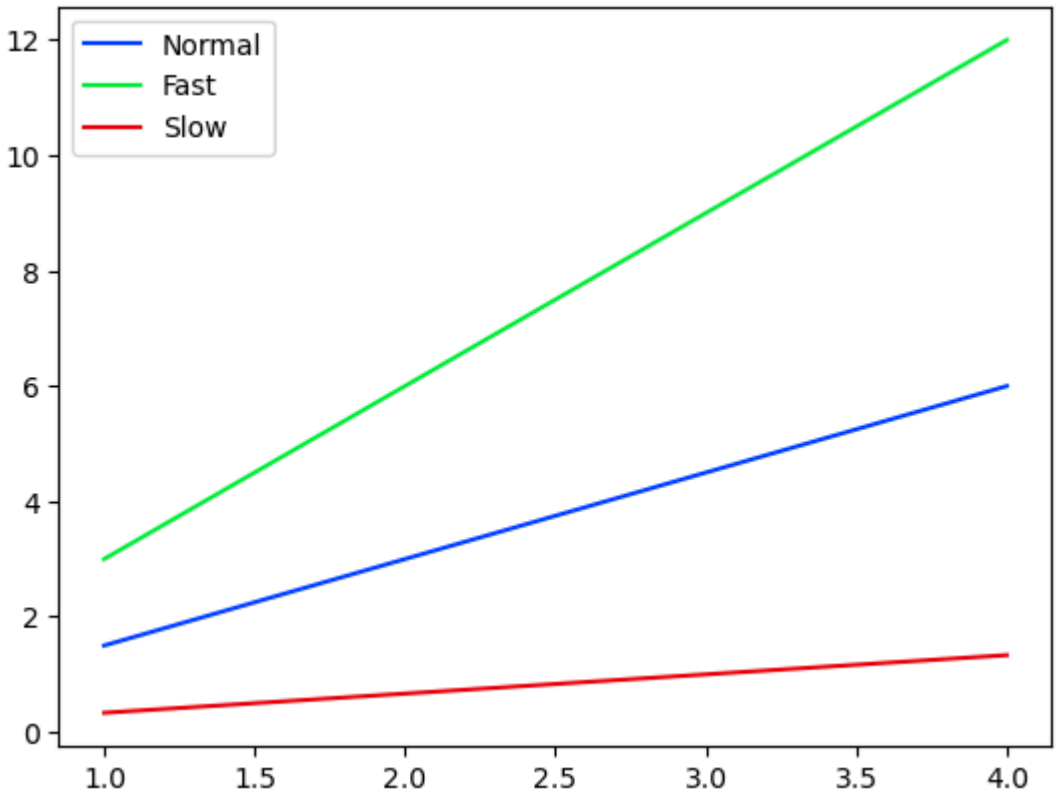
#Adding Legend
x15 = np.arange(1, 5)
fig, ax = plt.subplots()
ax.plot(x15, x15*1.5)
ax.plot(x15, x15*3.0)
ax.plot(x15, x15/3.0)
ax.legend(['Normal','Fast','Slow'])
```

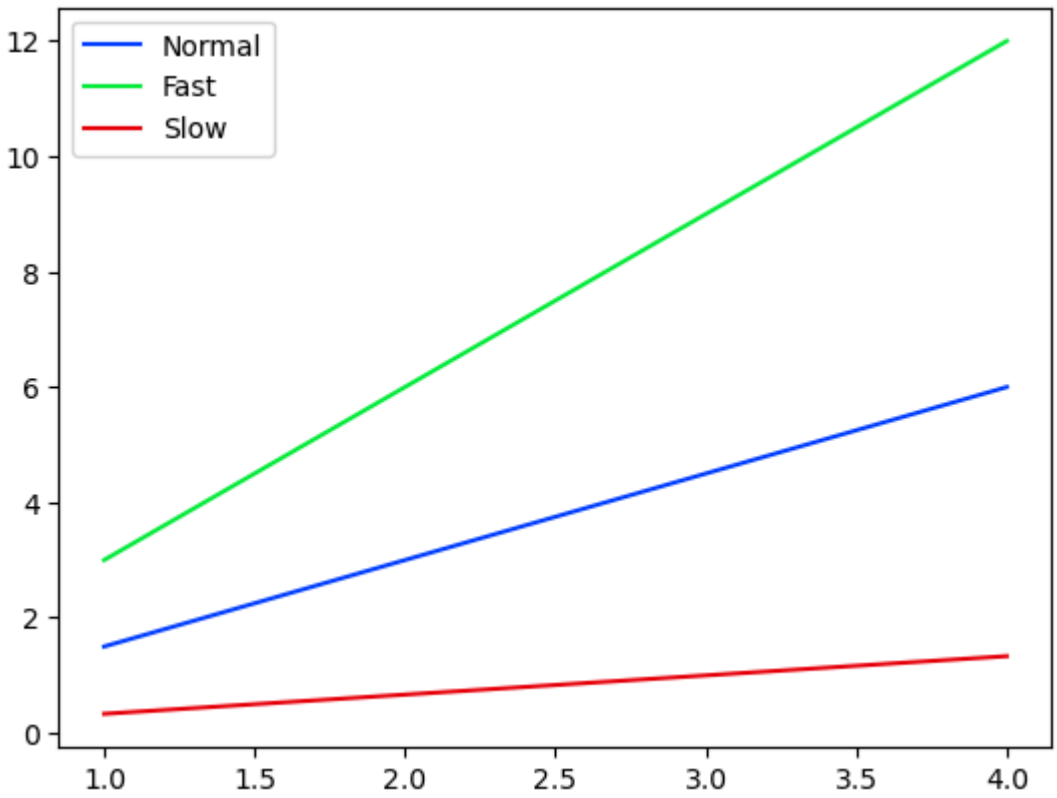
Out[131… <matplotlib.legend.Legend at 0x2947e3594f0>



The above method follows the MATLAB API. It is prone to errors and unflexible if curves are added to or removed from the plot. It resulted in a wrongly labelled curve.

In [134…

```
x15 = np.arange(1, 5)
fig, ax = plt.subplots()
ax.plot(x15, x15*1.5, label='Normal')
ax.plot(x15, x15*3.0, label='Fast')
ax.plot(x15, x15/3.0, label='Slow')
ax.legend();
```



The legend function takes an optional keyword argument loc. It specifies the location of the legend to be drawn. The loc takes numerical codes for the various places the legend can be drawn. The most

common loc values are as follows:-

- ax.legend(loc=0) # let Matplotlib decide the optimal location
- ax.legend(loc=1) # upper right corner
- ax.legend(loc=2) # upper left corner
- ax.legend(loc=3) # lower left corner
- ax.legend(loc=4) # lower right corner
- ax.legend(loc=5) # right
- ax.legend(loc=6) # center left
- ax.legend(loc=7) # center right
- ax.legend(loc=8) # lower center
- ax.legend(loc=9) # upper center
- ax.legend(loc=10) # center
